

Cantron: the *super antioxidant formulation* developed by scientists with activity far above those of normal antioxidants!!!

6 radical antioxidant protection

Cantron: An Incredible Wellness Formulation with Unparalleled Antioxidant Activity

Discover the Cantron Difference

There are dozens of antioxidant products that are promoted for their *super antioxidant properties*. The actual truth is that up until now antioxidants in the marketplace have been *severely limited* in their ability to provide adequate antioxidant protection against the persistent onslaught of the various *different types of health damaging free radicals* that incessantly attack tissues, membranes, organs and cells every nanosecond. As a result of these limitations, current antioxidants actually fail to provide humans and animals with much needed protection against the 50 or more different disease states that are caused by these pernicious free radical attacks.

What makes Cantron superior to all other antioxidants in the marketplace?

Cantron is no ordinary antioxidant. It has activity far above those of normal antioxidants, in fact, Cantron is the world's only true *super antioxidant formulation*.

There are 3 major reasons why it is vastly superior to all other antioxidants.

- Cantron works on all of the different types and combinations of free radicals that are indicated as a cause of over 50 different disease states where other antioxidants do not.
- Cantron has the highest ability of all known antioxidants to quench each and every one of these dangerous free radicals as determined by independent testing.
- Cantron is available in the bloodstream and tissues at optimum levels every nanosecond of the day while others are not.

Jim Nichols, president of Brunswick Laboratories stated, "There are five major radicals causing oxidative damage in the human body. In combination, they cause DNA, protein, and lipid damage, contribute to systemic inflammation and other harmful pathways. **Defending against just one of these radicals is like patching just one of five holes of the boat.**" In addition to the five major free radicals (peroxyl, hydroxyl, peroxynitrite, superoxide and singlet oxygen), there are 2 forms of peroxyl radicals- the water-soluble peroxyl radical (hydrophilic) and fat-soluble peroxyl radical (lipophilic). This adds up to **six different types of free radicals**, all of which **Cantron** is highly effective against. For example, vitamin C or Green Tea Extract is effective on water-soluble peroxyl radicals but not effective against fat-soluble peroxyl radicals. The reverse is true with vitamin E as it is effective on the fat-soluble types but not the water-soluble types.

Therefore to get the 6 radical protection of Cantron and defense against the vast combinations of

free radical attacks, one would have to take several different types of antioxidants.

Cantron is not only the most versatile antioxidant to ever exist, but according to testing conducted at Brunswick Laboratories -the world's foremost antioxidant testing laboratory- it has vastly higher scores than any known antioxidant on each of the free radicals types. Therefore, to match the antioxidant properties of **Cantron** one would not only have to take several different types of antioxidants, but they would have to take extremely large amounts of them as well.

Statistics show that 80% of the population is consuming less than 1000 ORAC units in an entire day (ORAC is the measure of peroxy radical scavenging ability) and consequently they are severely deficient in vital antioxidant protection. A standard daily dose of four 350 mg **Cantron** capsules can provide 11,650 ORAC units and over 17,500 ORAC units with the optional dose of six capsules per day.

Cantron also contains equally impressive quantities of HORAC, NORAC and SORAC units as well (measures of the scavenging ability of the various other free radical types).

It is one thing to consume large amounts of antioxidants and yet another to have the optimal amount in the bloodstream at all times when free radicals occur. Most antioxidants spend a relatively small amount of time in the bloodstream and tissues. The fact is that they are rapidly dissipated usually within an hour or two and not available when they are needed.

When discussing optimum levels of antioxidants, low amounts in the bloodstream are not the only issue. Consuming too many antioxidant units at one time can be wasteful. Dr. Ronald Prior of the US Department of Agriculture Research Service at Tufts University, Boston, Massachusetts, stated that taking in 25,000 ORAC units at one time would be no more beneficial than taking in a fifth of that amount: the excesses would simply be excreted by the kidneys because the antioxidant capacity of the blood is tightly regulated and that one will not benefit from increasing their daily intake of antioxidants by more than 5000 units at one time. This is why **Cantron's** dosing schedule is so important. With **Cantron**, its high levels of 6 different types of antioxidant units are distributed in the bloodstream at all times; thus, one will never have levels that are too low which would be dangerous or levels that are too high which would be wasteful. You'll have optimally high levels of antioxidants in the bloodstream each and every nanosecond of each and every day in order to combat the whole spectrum of health damaging free radicals and multiple combinations of the various free radical types.

No other antioxidant on the market can make these claims and no other antioxidant on the market can measure up to the unparalleled 6 radical antioxidant activity of Cantron. It is the world's only true super antioxidant. Buy it now and start protecting yourself and your loved ones today!
